Description

Enable hostel residents to create maintenance tickets by providing room number, issue category, severity, description, and optional photo

### 1. Did your estimations reflect the actual effort?

The story point estimates were reasonably close to the effort observed during the simulated sprints. Simpler stories such as viewing status or providing a rating required fewer points, while stories involving ticket creation, assignment and history tracking required more effort because of their higher complexity and dependencies.

### 2. Was your backlog well-prioritized?

Yes. The backlog was prioritized according to the business importance of the requirements from Lab 1. Core functions such as creating, assigning and updating maintenance tickets were given higher priority because they are essential to the maintenance workflow.

### 3. How did your simulated sprint align with your plan?

Sprint 1 focused on the core ticket creation, assignment and tracking process, while Sprint 2 focused on resolution, history and closure. This division allowed the main workflow to be completed first and the remaining functionality to be handled in the second sprint.

### 4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed how quickly the planned story points were being completed. It helped compare actual progress with the expected progress line and provided an indication of whether the sprint workload was realistic.
